Experiment 13: Limitations of Low-Code and Hybrid Solutions

Aim

To study the limitations of Zoho Creator found while building the gym application and to propose hybrid solutions.

Theory

Low-code platforms speed up development but have limits in customisation, formats and plan restrictions. Hybrid solutions use low-code for common parts and custom code for special requirements.

Procedure

1. Auto Number field offered only a start index, with no prefix or year, so the GYM-MEM-year-6 digit format was not possible directly.

2. Range limits (discount 0-20, fee not negative) needed a Deluge workflow instead of a field setting.

3. The choice editor allowed only newly added rows to be edited, which made editing default choices slow.

4. Dropping a SubForm onto the canvas by drag was unreliable in the builder.

5. Trial plan limits apply to users, environments and permission sets.

6. Hybrid proposal: use a Deluge function (or a Zoho Catalyst function) to build the Membership ID text and call it from the form workflow.

Output

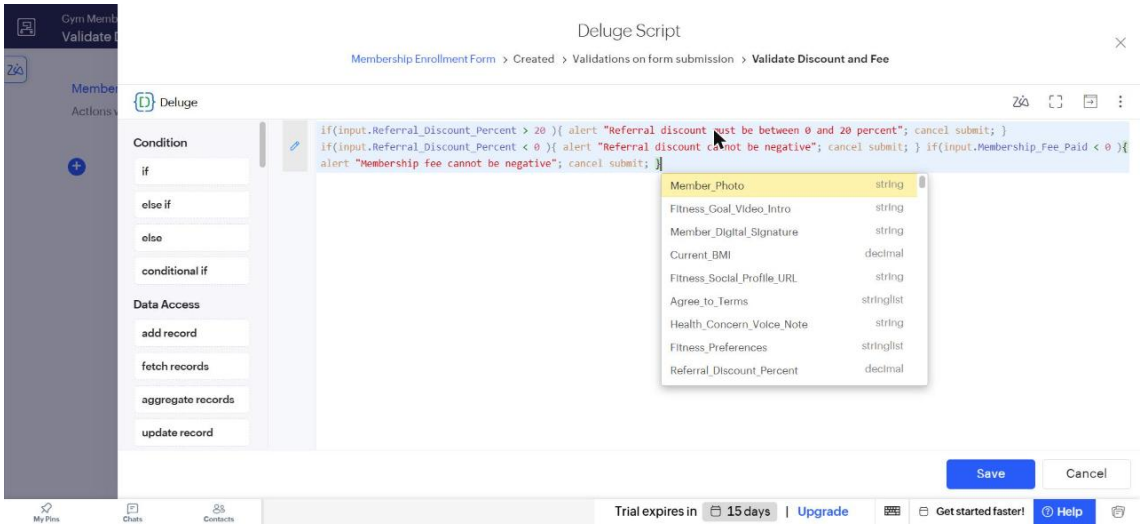

Fig 13.1 Deluge script used for range validation

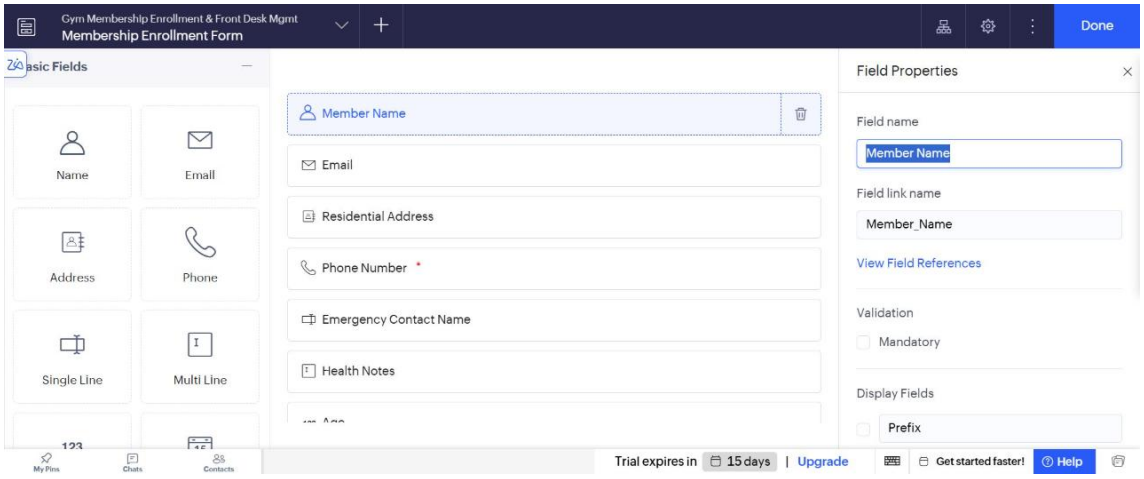

Fig 13.2 Form builder showing Auto Number field

Result

Limitations were identified and hybrid solutions proposed.
