Experiment 15: Career Pathways and Certification Planning

Aim

To study career pathways in low-code development and plan certifications using the experience from the gym application project.

Theory

Low-code skills are in demand because organisations want applications built quickly. People who know low-code tools and also basic coding are valued.

Procedure

1. Roles: Citizen Developer (builds simple apps with forms and reports), Low-Code Developer (adds workflows and Deluge), Solution Architect (designs integrations and security).

2. Skills from this project: form design, lookups, SubForms, reports, dashboards, Deluge validation, roles and environments.

3. Certification options: Zoho Creator certification, Microsoft Power Apps (PL-900, PL-100), Salesforce Administrator, OutSystems Associate.

4. Plan: complete the Zoho Creator certification first, then learn REST APIs and a programming language such as Python or JavaScript, then a second platform.

Output

Result

A career pathway and certification plan was prepared.
